

SentinelEdge User Guide

Simple & Automatic Data Protection for Your AI Conversations

Section 1: Introduction & Installation

The Concept

Welcome to SentinelEdge!

SentinelEdge is your personal local privacy bouncer for the web. It sits quietly inside your web browser between your keyboard and AI tools like ChatGPT, Claude, and Google Gemini.

Whenever you ask an AI a question, SentinelEdge checks your message right on your device. If it spots sensitive secrets—like API keys, passwords, credit card numbers, or private ID numbers—it automatically masks them before your text ever travels across the internet to AI cloud servers. Your personal information stays 100% private and on your computer at all times.

Step 1: Extract (Unzip) Your Download

- Locate the downloaded SentinelEdge zip file on your computer.
- Right-click the zip file and choose Extract All (Windows) or double-click it (Mac).
- Move the extracted folder to a permanent, safe location on your hard drive (such as your Documents or Projects folder) so it doesn't get moved or deleted by mistake.

Step 2: Set Up Your Browser

Google Chrome & Brave Browser

- Open your browser and type `chrome://extensions` in Chrome (or `brave://extensions` in Brave) into the top address bar, then press Enter.
- Look at the top-right corner of the page and switch Developer mode to ON.
- Click the Load unpacked button that appears in the top-left menu.
- Select the extracted dist folder inside your SentinelEdge folder.
- You're all set! The SentinelEdge shield icon will appear in your extension toolbar.

Mozilla Firefox

- Open Firefox and type `about:debugging` into the address bar, then press Enter.
- Click This Firefox on the left-hand menu.
- Click the Load Temporary Add-on... button.
- Open your extracted SentinelEdge folder and select the extension file (`manifest.json` inside the dist folder).
- SentinelEdge is now active on your Firefox browser!

Section 2: Daily Usage

Zero Friction (Works Automatically)

You do not need to change how you work. Simply open ChatGPT (chatgpt.com), Claude (claude.ai), or Gemini (gemini.google.com) and use them exactly as you normally do. SentinelEdge runs completely invisibly in the background.

When Pasting

If you copy a text block or code containing a secret (such as a private key, password, or credit card number) and paste it into an AI chat box:

SentinelEdge instantly catches the secret the exact millisecond you paste. It automatically replaces the sensitive value with a safe placeholder tag (such as [REDACTED_AWS_KEY]).

Your secret is masked before it ever touches your screen or the AI website.

 When Typing (Just-In-Time Protection)

SentinelEdge lets you type naturally without any lag or interruption:

As you type your prompt, SentinelEdge stays out of your way. You can read, verify, and format your thoughts normally.

The split-second you hit Enter or click the Send button, SentinelEdge pauses the message for a fraction of a millisecond, scans for any accidental secrets, masks them safely, and then releases your clean message to the AI.

You are protected right before the data leaves your computer.

Section 3: Troubleshooting & Errors

? Issue 1: The extension isn't replacing sensitive text

Solution: The AI webpage may need a quick reset to connect with SentinelEdge. Perform a hard refresh on the AI website by holding Ctrl + Shift + R (Windows) or Cmd + Shift + R (Mac).

? Issue 2: My message won't send when I press Enter or click Send

Solution: AI platforms like ChatGPT occasionally update their website designs, which can temporarily disrupt button connections. If a message gets stuck, temporarily turn off the extension in your browser settings (chrome://extensions), refresh the page to send your message, and check back for a SentinelEdge update.

? Issue 3: A normal, safe word was masked by mistake (False Positive)

Solution: Occasionally, a regular number or word typed next to terms like "pin" or "code" might trigger a safety tag. If this happens, simply highlight and delete the [REDACTED_...] placeholder text, slightly rephrase your sentence (for example, changing pin 2026 to year 2026), and resend your prompt.
